simuluation method

Given:

$$\frac{dy}{dx} + \sec(x) \cdot y = \tan(x)$$

Rewriting:

$$\frac{dy}{dx} = \tan(x) - y \cdot \sec(x)$$

Using the definition of derivative:

$$\lim_{h \to 0} \frac{y(x+h) - y(x)}{h} = \tan(x) - y \cdot \sec(x)$$

Approximating for small h:

$$\frac{y_{n+1} - y_n}{h} \approx \tan(x) - y \cdot \sec(x)$$

Reorganizing:

$$y_{n+1} - y_n = h \cdot \frac{dy}{dx}$$

Therefore:

$$y_{n+1} = y_n + h \cdot \frac{dy}{dx}$$

$$y_{n+1} = y_n + h \cdot (\tan(x_n) - y_n \cdot \sec(x_n))$$

By initializing the values of x and y and iterating the process several times and plotting them gives the curve for solution of the differential equation

Theoretical solution:

Consider the differential equation:

$$\frac{dy}{dx} + \sec(x)y = \tan(x)$$

where $0 \leq x < \frac{\pi}{2}$.

This is a first-order linear differential equation of the form:

$$\frac{dy}{dx} + P(x)y = Q(x)$$

where $P(x) = \sec(x)$ and $Q(x) = \tan(x)$.

The integrating factor (IF) is given by:

$$I(x) = e^{\int P(x)\,dx} = e^{\int \sec(x),dx}.$$

The integral of $\sec(x)$ is:

$$\int \sec(x)\,dx = \ln|\sec(x) + \tan(x)|.$$

Thus, the integrating factor becomes:

$$I(x) = e^{\ln|\sec(x)+\tan(x)|} = |\sec(x) + \tan(x)|.$$

Applying the integrating factor to the differential equation:

$$\frac{d}{dx}(y \cdot |\sec(x) + \tan(x)|) = \tan(x)|\sec(x) + \tan(x)|.$$

Integrate both sides:

$$y \cdot |\sec(x) + \tan(x)| = \int \tan(x)|\sec(x) + \tan(x)|\ dx.$$

Observe that the derivative of $\sec(x) + \tan(x)$ is $\sec(x)\tan(x) + \sec^2(x)$, so the integral simplifies to:

$$y \cdot |\sec(x) + \tan(x)| = |\sec(x) + \tan(x)| + C.$$

Therefore, the general solution is:

$$y = 1 + \frac{C}{|\sec(x) + \tan(x)|}$$

where C is the constant of integration.
